University of Arizona
Arizona Methods Workshops
January 7-9, 2016

Overview

- Day 1: Introductions and overview
 - Review of QCA resources, publications, and software
 - QCA as an investigation of invariance
 - Three analytic components of QCA: dataset calibration, necessity analysis, and sufficiency analysis
 - Three types of QCA projects: identifying causal recipes, uncovering taxonomies, understanding context
 - Discussion of research projects
- Day 2: Nuts and bolts—QCA in depth
 - Dataset calibration
 - Necessity analysis
 - Consistency and coverage measures for necessity
 - Testing for necessary conditions
 - Sufficiency analysis
 - Consistency and coverage measures for sufficiency
 - Constructing and reducing truth tables
 - Interrogating the analysis and deriving solutions
- Day 3: Workshop Projects

Boolean Algebra

- UPPERCASE for the presence of a condition
- lowercase or \sim for the absence of a condition
- Negation
$$\sim A = 1 - A$$
$$a = 1 - A$$
- Logical and (Boolean multiplication/Set intersection)
$$A \cdot b = Ab = \min(A, b)$$
- Logical or (Boolean addition/Set union)
$$A + b = \max(A, b)$$

Three Analytic Components of QCA

A vertical teal decorative border with a wavy, marbled texture runs along the left edge of the slide.

Calibrating Datasets

Dataset Calibration

- Instrument calibration is routine in the natural sciences; largely absent in the social sciences.
- Social sciences emphasize relative effects: Paul is poorer than Peter; the United States is more democratic than North Korea.
- Calibration allows us to state that an individual is poor or that a country is democratic.
- Calibration requires application of theoretical and substantive knowledge.

Calibrating Fuzzy Sets

Crisp set	Three-value fuzzy set	Four-value fuzzy set	Six-value fuzzy set	Continuous fuzzy set
1 = fully in	1 = fully in	1 = fully in	1 = fully in	1 = fully in
	0.67 = more in than out	0.67 = more in than out	0.8 = mostly but not fully in 0.6 = more or less in	Degree of membership is more "in" than "out" $0.5 < X < 1$
----- 0.5 = Crossover Point -----				
		0.33 = more out than in	0.4 = more or less out 0.2 = mostly but not fully out	Degree of membership is more "out" than "in" $0.0 < X < 0.5$
0 = fully out	0 = fully out	0 = fully out	0 = fully out	0 = fully out

Calibrating Fuzzy Sets

- Methods of calibration:
 - Manually
 - “Direct” Method
 - “Indirect” Method
- Fuzzy sets are asymmetrical
- Fuzzy sets vs crisp-sets vs dummy variables
- Fuzzy sets vs multi-valued sets

Analyzing Necessary Conditions

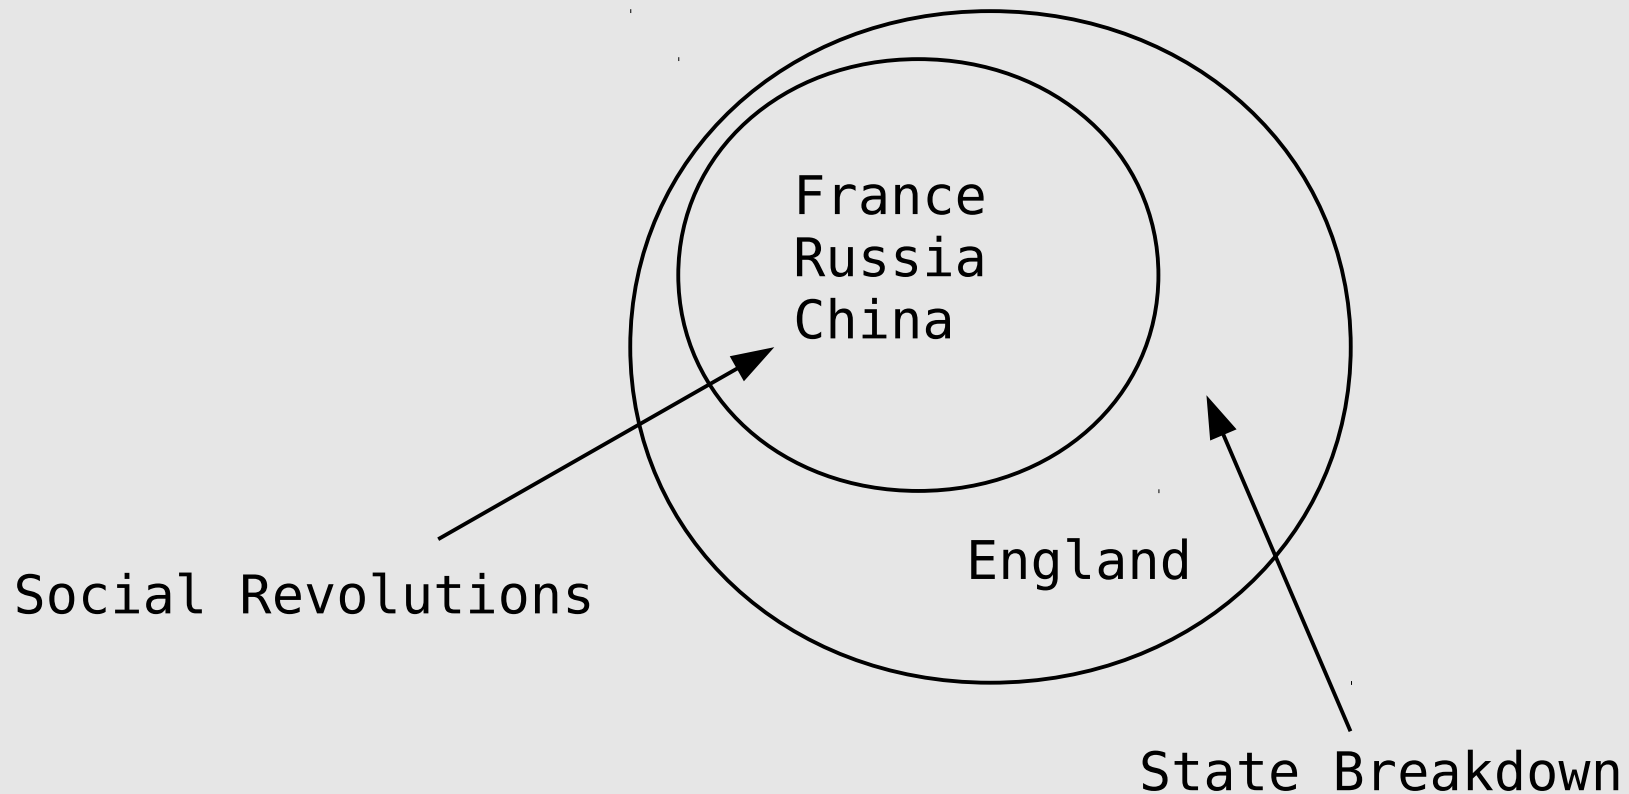

Necessity Analysis

- Underdeveloped in the literature; QCA development has focused on sufficiency analysis
- *Kirq* and *acq* have sophisticated necessity testing

Necessary Conditions

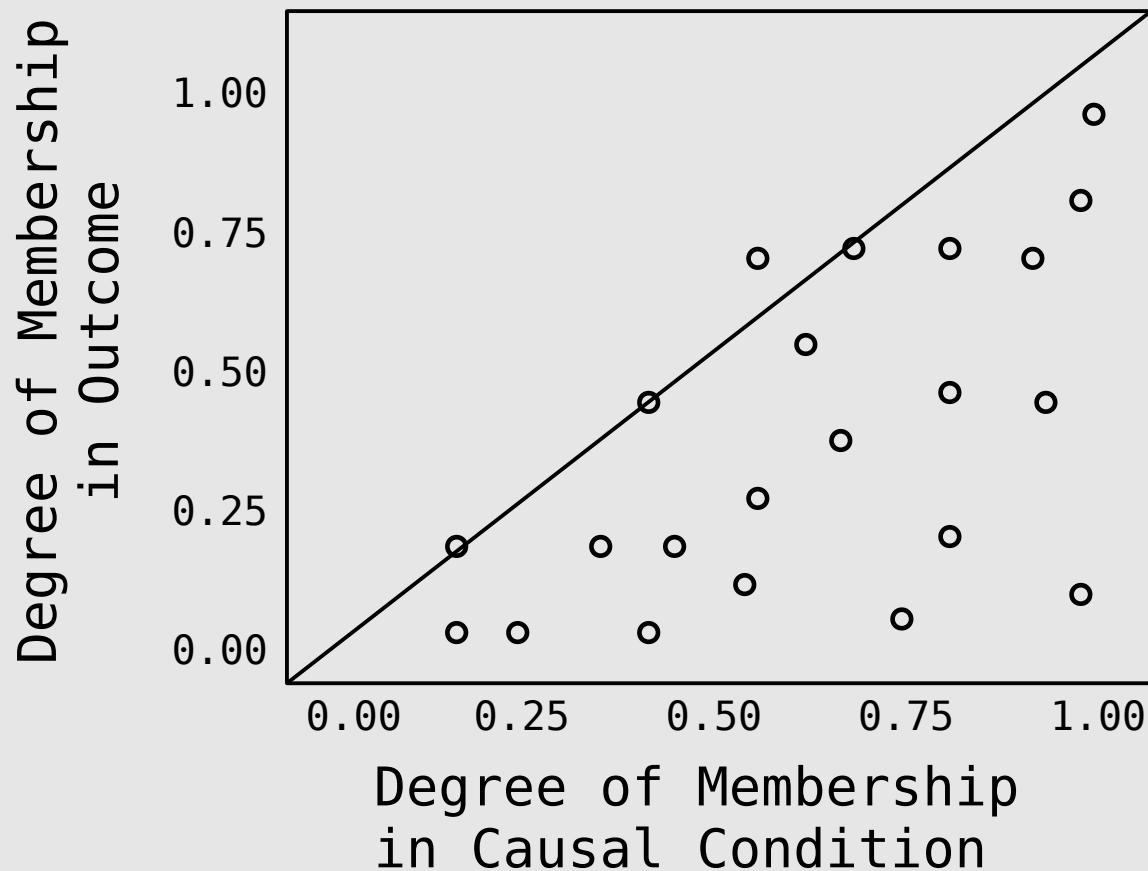

Causal condition must (almost always) be present for outcome to occur.

Outcome is a subset of Cause

Fuzzy Subset Relationship Consistent with Necessity

Outcome is a subset of Cause ($X \geq Y$)

Assessing Necessary Conditions

- *Consistency* measures degree to which subset relationship is “consistent” with necessity

Subset relationship consistent with necessity

Subset relationship with substantial inconsistency

Assessing Necessary Conditions

- *Coverage* measures how “relevant” a necessary condition is

Empirically relevant necessary condition (high consistency)

Empirically irrelevant necessary condition (perfect consistency)

Testing for Necessary Conditions

Obs	Dev	Urb	Lit	Sur
AT	.81	.12	.99	.05
BE	.99	.89	.98	.95

PT	.01	.02	.01	.05

Term	Consis	Cov
LIT	0.99	0.58
Solution	0.99	0.58

Testing for Necessary Conditions

- Assess consistency before coverage
- Join terms with logical or (e.g., $A+B+C$)
- Many solutions are possible
- Use of theory is crucial

Analyzing Sufficient Conditions

Sufficiency Analysis

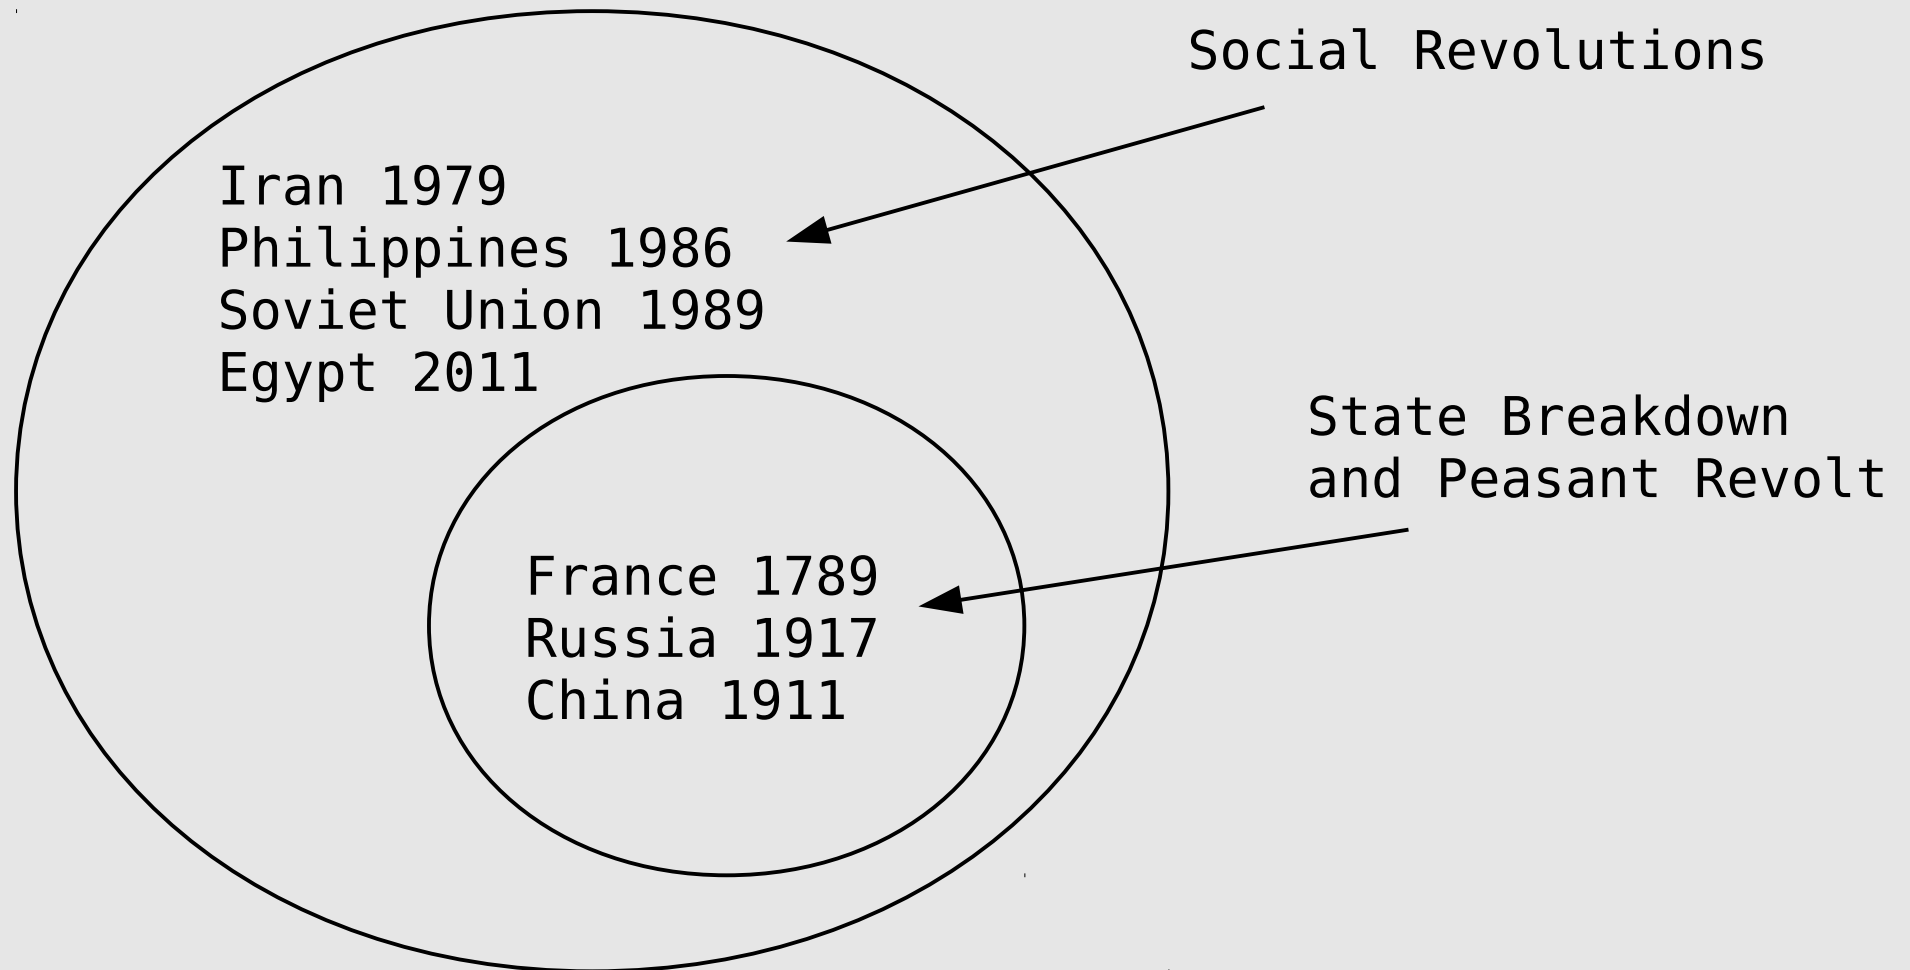

- More mature than necessity analysis; QCA development—and applications—have focused on sufficiency analysis
- Emphasis on causal complexity (a.k.a., multiple conjunctural causation, “recipes,” equifinality, or INUS conditions)

Feature	fs/QCA	Kirq & acq
Based on RSI Algorithms	✓	✓
Complex Solutions	✓	✓
Intermediate Solutions	✓	
Parsimonious Solutions	✓	✓
Impossible Conditions		✓
Contradictions		✓

Sufficient Conditions

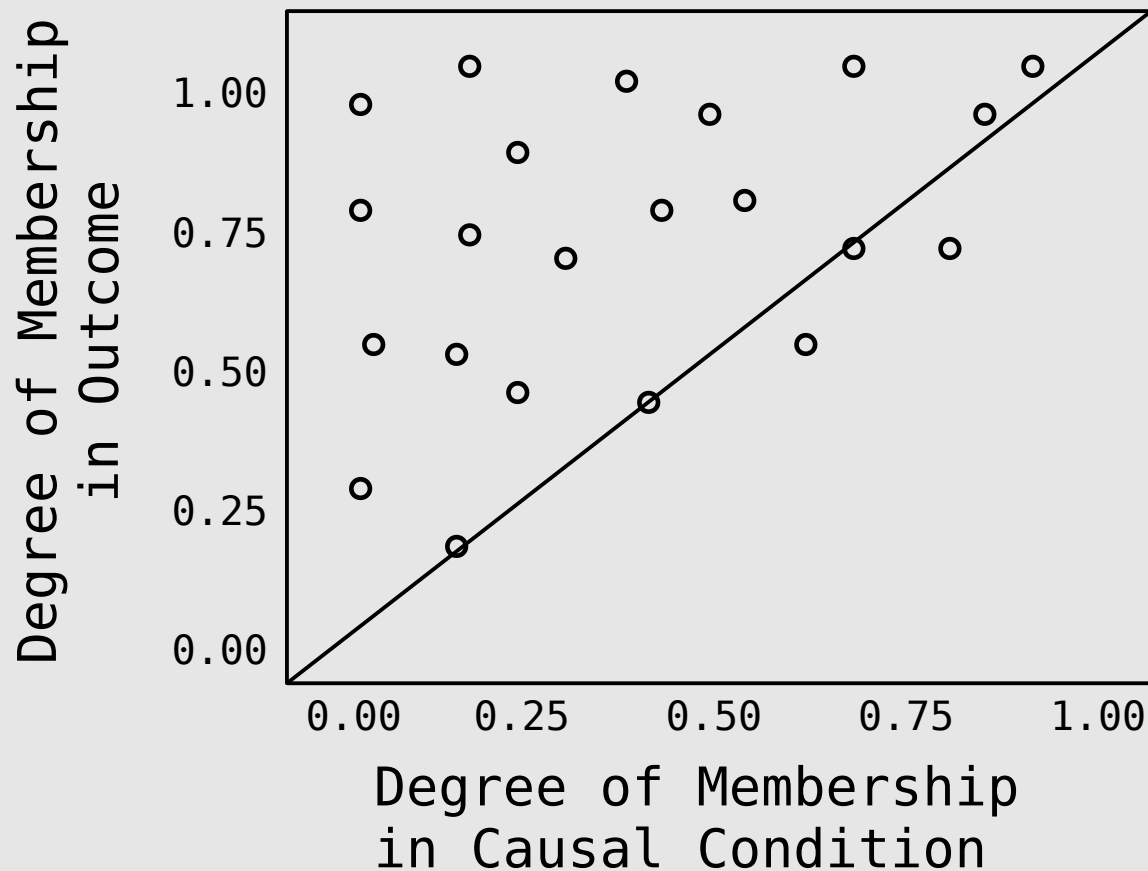

Outcome (almost) always occurs when causal condition is present.

Cause is a subset of Outcome

Fuzzy Subset Relationship Consistent with Sufficiency

Cause is a subset of Outcome ($Y \geq X$)

Assessing Sufficient Conditions

- *Consistency* measures degree to which subset relationship is “consistent” with sufficiency

Subset relationship consistent
with sufficiency

Subset relationship with
substantial inconsistency

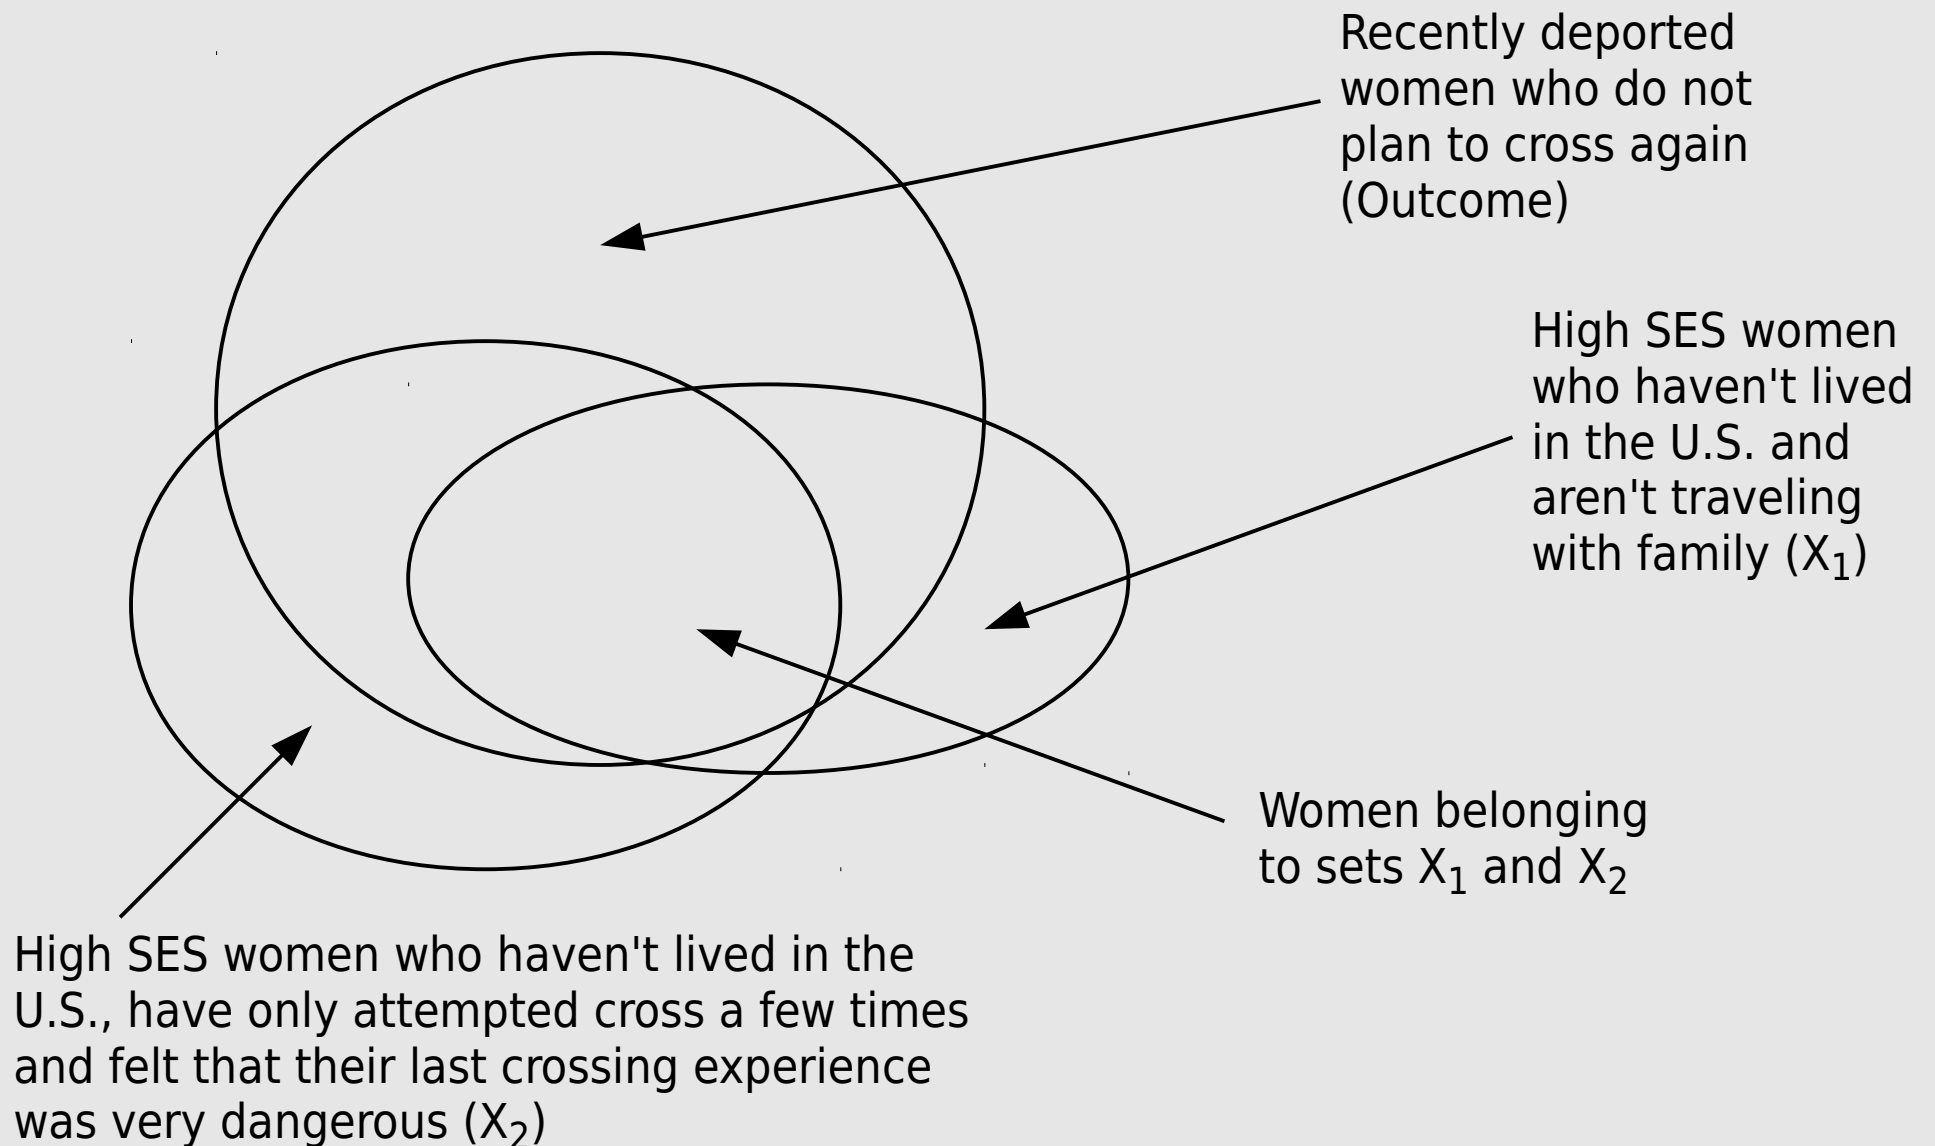

Assessing Sufficient Conditions

- *Coverage* measures the relative “importance” of each solution

Assessing Sufficient Conditions

- *Coverage* measures the relative “importance” of each solution

Testing for Sufficient Conditions

Reading Truth Tables

Truth table assesses consistency between types and outcome

Democracy usually did not break down in countries that were (a) developed, urbanized, and literate (row 1) or (b) developed, not urbanized, and literate (row 3).

Democracy usually did break down in countries that were (c) not developed, not urbanized, and literate (row 7) or (d) not developed, not urbanized, and not literate (row 8)
